August 2, 2019
11:30 AM – 1:00PM

Early Detection of Infants at High Risk of Cerebral Palsy

Presented by
Sandy Heimerl, DPT, Physical Therapist
August 2, 2019
11:30 am – 1:00 pm
1.5 PT or OT Continuing Education Contact Hours are available at no cost

While cerebral palsy diagnoses have traditionally been made at age 2 or older, recent studies have shown that a trained provider can identify infants at high risk by 6 months of age. Early recognition of physical indicators is essential in order to target intervention during the period of greatest brain plasticity. The rationale for early identification, an overview of early neuroplasticity, the standardized tools used to identify infants at high risk for cerebral palsy and the recommendations from the recently published International Clinical Practice Guideline (Novak et al 2017) will be presented.
